

Generative Research and Development (Week 5)

February 6th - 13th 2025

<https://sighack.com/post/getting-creative-with-perlin-noise-fields>

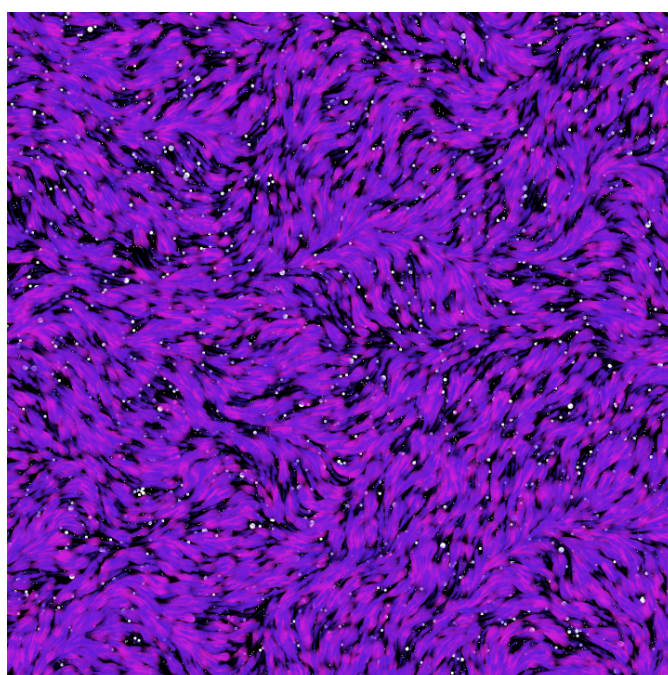

By: Manohar Vanga

This topic and research concept explores unique ways to use Perlin noise in creative coding. It provides insights into various methods of understanding and utilizing it, as well as the theoretical basis behind its workings. Examples are demonstrated in a way that showcases different iterations, allowing us to see its versatility. Additionally, the concept is applied in animation-based settings, illustrating its dynamic potential. Overall, the site offers valuable explanations of the visual possibilities and diverse ways Perlin noise can be used to enhance creativity.

I am personally interested in this topic and eager to learn more about it, as it is such a unique concept with captivating visuals. The idea of motion-based code is particularly intriguing to me, and I want to delve deeper into the mechanics behind it. From an artistic perspective, I am curious to understand how these visuals are created and to explore similar techniques.

Some key notes I gathered from this research include:

- Exploring different line parameters
- Retaining procedural colors while experimenting with other shapes
- Reflecting on the ephemeral nature of the images discovered during these explorations
- Varying the scale of the force to achieve diverse effects
