

Generative Research and Development (Week 3)

January 23rd - 30th 2025

By: Patrik Hübner

“Visual research on autonomous, object-based poster generation using generative algorithms that build abstract shape-combinations.” This article and project showcases the idea of how creative coding can go above and beyond the idea to create cool and generative shapes. This article teaches and intrigues me as it goes above the idea of what shapes are but rather tells you ways on how you can move them, play where there values, generative algorithms and much more based on what we see in the project, from myself.

So for this week coming across something such as this, inspires me more to want to work with shapes, as shapes can form amazing and cool things even though they may seem basic. This work goes above the idea of basic shapes and rather displays the idea of how we can take these basic shapes and create a story, also said by himself, technical and narrative-driven which displays the ways in which this project was intriguing for myself.

Here are some more good works I found interesting as well that follow the same theme idea:
