

Generative Research and Development (Week 4)

January 30rd - February 6th 2025

<https://www.speech-graphics.com/news/the-growth-of-audio-driven-animation-and-speech-graphics-leading-the-future-of-performance-driven-animation>

By: Gregor Hofer (L) & Michael Berger (R)

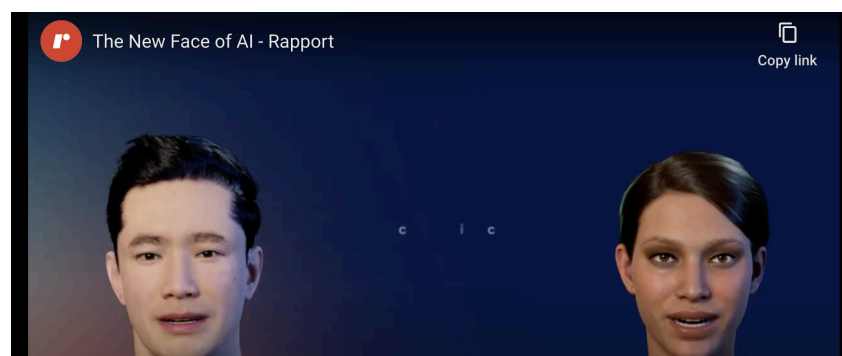

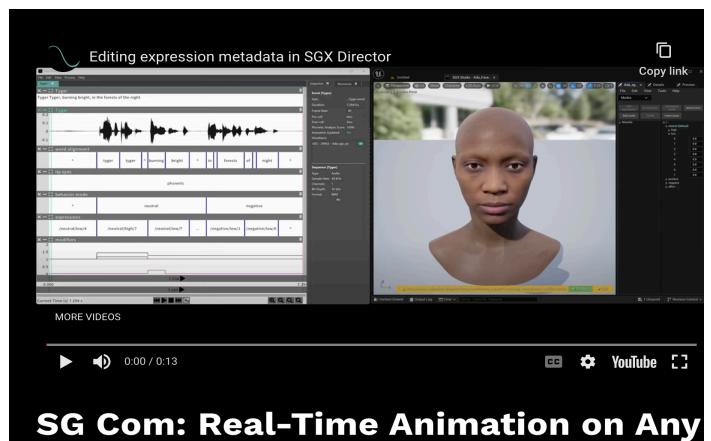

A cool way to display audio-driven animation and speech graphics in games is by using techniques that programmatically synchronize audio with visuals to create something generative and visually striking. This practice integrates audio-driven sounds and animation to produce a more realistic and immersive experience.

The technique, commonly applied in games and applications, offers a creative approach that enhances the connection between sound and animation. The article delves deeply into AI-driven factors, the evolution of animation, and the substantial creative control provided by these tools and techniques.

Rather than focusing on programming-heavy tools like Max or TouchDesigner, this article emphasizes the broader field of game development, showcasing how these methods can enrich creative projects with innovative and dynamic animations.

Some key and interesting points researched:

- Creative Control
- Behavior Modes & Modifiers
- Efficient Animation
- Rise of AI Experiences

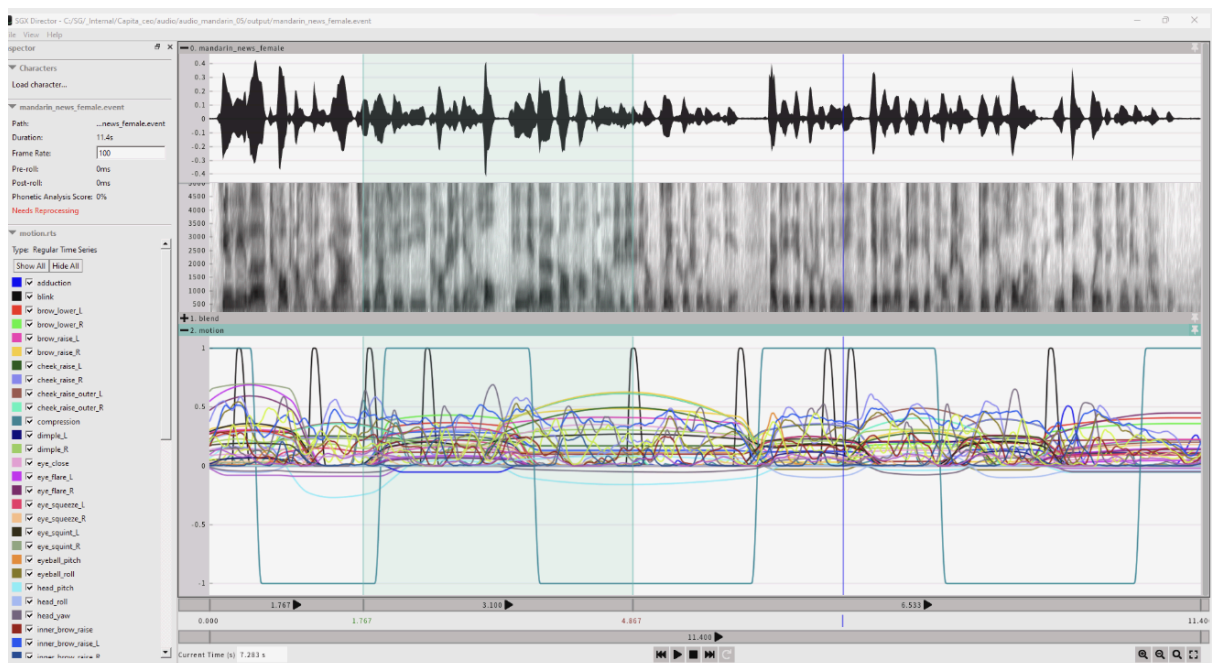

More info and research links about it.
